CheckDynData	<i>Check Dynamic Modeling Data</i>
--------------	------------------------------------

Description

The function checks whether a data frame has the variables and structure required by the dynamic modeling utility functions.

Usage

```
CheckDynData(  
  data,  
  id,  
  time,  
  observed,  
  covariates = NULL,  
  require_unique = TRUE,  
  require_numeric_time = TRUE,  
  require_numeric_observed = TRUE,  
  require_numeric_covariates = FALSE,  
  min_rows = 2L  
)
```

Arguments

data	Data frame. A data frame object of data for potentially multiple subjects that contain a column of subject ID numbers (i.e., an ID variable), a column indicating subject-specific measurement occasions (i.e., a TIME variable), at least one column of observed values.
id	Character string. A character string of the name of the ID variable in the data.
time	Character string. A character string of the name of the TIME variable in the data.
observed	Character vector. A vector of character strings of the names of the observed variables in the data.
covariates	Character vector. A vector of character strings of the names of the covariates in the data.

require_unique Logical. If TRUE, require unique id-time combinations.
 require_numeric_time Logical. If TRUE, require the time variable to be numeric.
 require_numeric_observed Logical. If TRUE, require observed variables to be numeric.
 require_numeric_covariates Logical. If TRUE, require covariates to be numeric.
 min_rows Positive integer. Minimum number of rows required per ID.

Value

Returns TRUE invisibly if all checks pass.

Examples

```

data <- data.frame(
  id = rep(1:2, each = 3),
  time = rep(1:3, times = 2),
  y1 = rnorm(6),
  y2 = rnorm(6)
)
CheckDynData(
  data = data,
  id = "id",
  time = "time",
  observed = c("y1", "y2")
)

```

DeleteInitialNA

Delete for NAs in Initial Row By ID

Description

The function removes initial rows by ID if they contain missing values. This process is repeated until the first row per ID no longer has missing observations.

Usage

```
DeleteInitialNA(data, id, time, observed, covariates = NULL, ncores = NULL)
```

Arguments

<code>data</code>	Data frame. A data frame object of data for potentially multiple subjects that contain a column of subject ID numbers (i.e., an ID variable), a column indicating subject-specific measurement occasions (i.e., a TIME variable), at least one column of observed values.
<code>id</code>	Character string. A character string of the name of the ID variable in the data.
<code>time</code>	Character string. A character string of the name of the TIME variable in the data.
<code>observed</code>	Character vector. A vector of character strings of the names of the observed variables in the data.
<code>covariates</code>	Character vector. A vector of character strings of the names of the covariates in the data.
<code>ncores</code>	Positive integer. Number of cores to use. If <code>ncores = NULL</code> , use a single core. Consider using multiple cores when number of individuals is large.

Value

Returns a data frame.

Examples

```
if (requireNamespace("simStateSpace", quietly = TRUE)) {
  # prepare parameters
  set.seed(42)
  ## number of individuals
  n <- 5
  ## time points
  time <- 5
  ## dynamic structure
  p <- 3
  mu0 <- rep(x = 0, times = p)
  sigma0 <- 0.001 * diag(p)
  sigma0_1 <- t(chol(sigma0))
  alpha <- rep(x = 0, times = p)
```

```

beta <- 0.50 * diag(p)
psi <- 0.001 * diag(p)
psi_l <- t(chol(psi))

library(simStateSpace)
ssm <- SimSSMVARFixed(
  n = n,
  time = time,
  mu0 = mu0,
  sigma0_l = sigma0_l,
  alpha = alpha,
  beta = beta,
  psi_l = psi_l,
  type = 0
)
data <- as.data.frame(ssm)
# Replace first row with NA
data[1, paste0("y", 1:p)] <- NA
DeleteInitialNA(
  data = data,
  id = "id",
  time = "time",
  observed = paste0("y", 1:p)
)
}

```

DeltaTByID

Summarize Time Intervals by ID

Description

The function returns a diagnostic table describing the spacing of the time variable within each ID.

Usage

```

DeltaTByID(
  data,
  id,
  time,
  observed = NULL,
  covariates = NULL,
  tolerance = sqrt(.Machine$double.eps)
)

```

Arguments

<code>data</code>	Data frame. A data frame object.
<code>id</code>	Character string. A character string of the name of the ID variable in the data.

time	Character string. A character string of the name of the TIME variable in the data.
observed	Character vector. Optional vector of character strings of the names of the observed variables in the data.
covariates	Character vector. Optional vector of character strings of the names of the covariates in the data.
tolerance	Numeric. Tolerance used to determine whether the time intervals are regular.

Value

Returns a data frame with one row per ID.

Other Dynamic Modeling Utility Functions: [CheckDynData\(\)](#), [DeleteInitialNA\(\)](#), [DetrendByID\(\)](#), [ElapsedTimeByID\(\)](#), [FilterByID\(\)](#), [InitialNA\(\)](#), [InsertNA\(\)](#), [LagByID\(\)](#), [MakeClockTime\(\)](#), [RegularizeTimeByID\(\)](#), [ReplaceMissingCode\(\)](#), [ResolveDuplicateIDTime\(\)](#), [RoundClockTime\(\)](#), [ScaleByID\(\)](#), [SubsetByID\(\)](#), [SummaryByID\(\)](#)

Examples

```
data <- data.frame(
  id = rep(1:2, each = 3),
  time = c(1, 2, 3, 1, 3, 4),
  y = rnorm(6)
)
DeltaTByID(
  data = data,
  id = "id",
  time = "time",
  observed = "y"
)
```

DetrendByID

Detrend Observed Variables by ID

Description

The function removes polynomial time trends from observed variables within each ID. Missing observed values are ignored when estimating the trend and remain missing in the residualized variables.

Usage

```
DetrendByID(
  data,
  id,
  time,
  observed,
  covariates = NULL,
  degree = 1L,
  replace = FALSE,
  prefix = "detrend"
)
```

Arguments

data	Data frame. A data frame object of data for potentially multiple subjects that contain a column of subject ID numbers (i.e., an ID variable), a column indicating subject-specific measurement occasions (i.e., a TIME variable), at least one column of observed values.
id	Character string. A character string of the name of the ID variable in the data.
time	Character string. A character string of the name of the TIME variable in the data.
observed	Character vector. A vector of character strings of the names of the observed variables in the data.
covariates	Character vector. A vector of character strings of the names of the covariates in the data.
degree	Non-negative integer. Degree of the polynomial trend. Use degree = 0 for mean centering by ID.
replace	Logical. If TRUE, replace observed variables with residualized variables. If FALSE, append residualized variables to the data frame.
prefix	Character string. Prefix for residualized variables when replace = FALSE.

Value

Returns a data frame.

Other Dynamic Modeling Utility Functions: [CheckDynData\(\)](#), [DeleteInitialNA\(\)](#), [DeltaTByID\(\)](#), [ElapsedTimeByID\(\)](#), [FilterByID\(\)](#), [InitialNA\(\)](#), [InsertNA\(\)](#), [LagByID\(\)](#), [MakeClockTime\(\)](#), [RegularizeTimeByID\(\)](#), [ReplaceMissingCode\(\)](#), [ResolveDuplicateIDTime\(\)](#), [RoundClockTime\(\)](#), [ScaleByID\(\)](#), [SubsetByID\(\)](#), [SummaryByID\(\)](#)

Examples

```
data <- data.frame(
  id = rep(1:2, each = 4),
  time = rep(1:4, times = 2),
  y = rep(1:4, times = 2)
)
DetrendByID(
  data = data,
  id = "id",
  time = "time",
  observed = "y",
  degree = 1
)
```

ElapsedTimeByID	<i>Create Elapsed Time by ID</i>
-----------------	----------------------------------

Description

The function creates an elapsed-time variable within ID. For date-time variables, elapsed time is computed with `difftime()`. For numeric time variables, elapsed time is computed by subtraction, optionally converting from `input_units` to units.

Usage

```
ElapsedTimeByID(
  data,
  id,
  time,
  output = "time_elapsed",
  units = "days",
  origin = c("by_id", "global"),
  input_units = NULL,
  replace = FALSE
)
```

Arguments

<code>data</code>	Data frame. A data frame object of data for potentially multiple subjects that contain a column of subject ID numbers (i.e., an ID variable), a column indicating subject-specific measurement occasions (i.e., a TIME variable), at least one column of observed values.
<code>id</code>	Character string. A character string of the name of the ID variable in the data.
<code>time</code>	Character string. A character string of the name of the TIME variable in the data.
<code>output</code>	Character string. Name of the elapsed-time variable.

units	Character string. Units for the output elapsed time.
origin	Character string. If origin = "by_id", each ID's origin is its own minimum non-missing time. If origin = "global", all IDs use the global minimum non-missing time.
input_units	Character string or NULL. Units of numeric input time. If NULL, numeric time is assumed to already be in the desired output scale and only subtraction is performed.
replace	Logical. If TRUE, replace the original time variable. If FALSE, append output.

Value

Returns a data frame.

Other Dynamic Modeling Utility Functions: [CheckDynData\(\)](#), [DeleteInitialNA\(\)](#), [DeltaTByID\(\)](#), [DetrendByID\(\)](#), [FilterByID\(\)](#), [InitialNA\(\)](#), [InsertNA\(\)](#), [LagByID\(\)](#), [MakeClockTime\(\)](#), [RegularizeTimeByID\(\)](#), [ReplaceMissingCode\(\)](#), [ResolveDuplicateIDTime\(\)](#), [RoundClockTime\(\)](#), [ScaleByID\(\)](#), [SubsetByID\(\)](#), [SummaryByID\(\)](#)

Examples

```
data <- data.frame(
  id = c(1, 1, 2, 2),
  datetime = as.POSIXct(
    c(
      "2020-01-01 00:00:00",
      "2020-01-02 00:00:00",
      "2020-01-03 12:00:00",
      "2020-01-04 00:00:00"
    ),
    tz = "UTC"
  )
)
ElapsedTimeByID(
  data = data,
  id = "id",
  time = "datetime",
  output = "time",
  units = "days"
)
```

FilterByID

*Filter Dynamic Modeling Data by ID***Description**

The function removes IDs that do not satisfy minimum data requirements.

Usage

```
FilterByID(
  data,
  id,
  time,
  observed,
  covariates = NULL,
  min_rows = 2L,
  min_complete = 2L,
  max_prop_missing = 1,
  allow_initial_na = TRUE,
  allow_all_missing = FALSE
)
```

Arguments

data	Data frame. A data frame object of data for potentially multiple subjects that contain a column of subject ID numbers (i.e., an ID variable), a column indicating subject-specific measurement occasions (i.e., a TIME variable), at least one column of observed values.
id	Character string. A character string of the name of the ID variable in the data.
time	Character string. A character string of the name of the TIME variable in the data.
observed	Character vector. A vector of character strings of the names of the observed variables in the data.
covariates	Character vector. A vector of character strings of the names of the covariates in the data.
min_rows	Non-negative integer. Minimum number of rows required per ID.
min_complete	Non-negative integer. Minimum number of complete observed rows required per ID.
max_prop_missing	Numeric. Maximum allowed proportion of missing values across observed variables.
allow_initial_na	Logical. If FALSE, remove IDs where the initial row contains missing values.
allow_all_missing	Logical. If FALSE, remove IDs where all observed values are missing.

Value

Returns a data frame.

Examples

```
data <- data.frame(
  id = rep(1:3, each = 3),
  time = rep(1:3, times = 3),
  y = c(1, 2, 3, NA, NA, 4, NA, NA, NA)
)
FilterByID(
  data = data,
  id = "id",
  time = "time",
  observed = "y",
  min_complete = 2
)
```

InitialNA

Check for NAs in Initial Row By ID

Description

The function checks if there are missing values for the initial row by ID.

Usage

```
InitialNA(data, id, time, observed, covariates = NULL, ncores = NULL)
```

Arguments

data	Data frame. A data frame object of data for potentially multiple subjects that contain a column of subject ID numbers (i.e., an ID variable), a column indicating subject-specific measurement occasions (i.e., a TIME variable), at least one column of observed values.
id	Character string. A character string of the name of the ID variable in the data.

time	Character string. A character string of the name of the TIME variable in the data.
observed	Character vector. A vector of character strings of the names of the observed variables in the data.
covariates	Character vector. A vector of character strings of the names of the covariates in the data.
ncores	Positive integer. Number of cores to use. If ncores = NULL, use a single core. Consider using multiple cores when number of individuals is large.

Value

Returns a vector of ID numbers where the initial row has any missing value.

Examples

```
if (requireNamespace("simStateSpace", quietly = TRUE)) {
  # prepare parameters
  set.seed(42)
  ## number of individuals
  n <- 5
  ## time points
  time <- 5
  ## dynamic structure
  p <- 3
  mu0 <- rep(x = 0, times = p)
  sigma0 <- 0.001 * diag(p)
  sigma0_l <- t(chol(sigma0))
  alpha <- rep(x = 0, times = p)
  beta <- 0.50 * diag(p)
  psi <- 0.001 * diag(p)
  psi_l <- t(chol(psi))

  library(simStateSpace)
  ssm <- SimSSMVARFixed(
    n = n,
    time = time,
    mu0 = mu0,
    sigma0_l = sigma0_l,
    alpha = alpha,
    beta = beta,
```

```

    psi_l = psi_l,
    type = 0
  )
data <- as.data.frame(ssm)
# Replace first row with NA
data[1, paste0("y", 1:p)] <- NA
InitialNA(
  data = data,
  id = "id",
  time = "time",
  observed = paste0("y", 1:p)
)
}

```

InsertNA

*Insert NAs for Missing Observations***Description**

The function creates a sequence of time values. It starts with the smallest time value as the starting point and the largest time value as the endpoint. The sequence is incremented by `delta_t`. This new sequence is combined with the existing empirical time values. For any specific time value where there are no observations, NAs are inserted.

Usage

```
InsertNA(data, id, time, observed, covariates = NULL, delta_t, ncores = NULL)
```

Arguments

<code>data</code>	Data frame. A data frame object of data for potentially multiple subjects that contain a column of subject ID numbers (i.e., an ID variable), a column indicating subject-specific measurement occasions (i.e., a TIME variable), at least one column of observed values.
<code>id</code>	Character string. A character string of the name of the ID variable in the data.
<code>time</code>	Character string. A character string of the name of the TIME variable in the data.
<code>observed</code>	Character vector. A vector of character strings of the names of the observed variables in the data.
<code>covariates</code>	Character vector. A vector of character strings of the names of the covariates in the data.
<code>delta_t</code>	Positive number. Time interval.
<code>ncores</code>	Positive integer. Number of cores to use. If <code>ncores = NULL</code> , use a single core. Consider using multiple cores when number of individuals is large.

Value

Returns a data frame.

  alpha <- rep(x = 0, times = p)
  beta <- 0.50 * diag(p)
  psi <- 0.001 * diag(p)
  psi_l <- t(chol(psi))

  library(simStateSpace)
  ssm <- SimSSMVARFixed(
    n = n,
    time = time,
    mu0 = mu0,
    sigma0_l = sigma0_l,
    alpha = alpha,
    beta = beta,
    psi_l = psi_l,
    type = 0
  )
  data <- as.data.frame(ssm)
  InsertNA(
    data = data,
    id = "id",
    time = "time",
    observed = paste0("y", 1:p),
    delta_t = 0.10
  )
}
```

```
}
```

LagByID

Create Lagged Variables by ID

Description

The function creates lagged observed variables within ID. Lagged values never cross ID boundaries.

Usage

```
LagByID(data, id, time, observed, covariates = NULL, lags = 1L, prefix = "lag")
```

Arguments

data	Data frame. A data frame object of data for potentially multiple subjects that contain a column of subject ID numbers (i.e., an ID variable), a column indicating subject-specific measurement occasions (i.e., a TIME variable), at least one column of observed values.
id	Character string. A character string of the name of the ID variable in the data.
time	Character string. A character string of the name of the TIME variable in the data.
observed	Character vector. A vector of character strings of the names of the observed variables in the data.
covariates	Character vector. A vector of character strings of the names of the covariates in the data.
lags	Positive integer vector. Lags to create.
prefix	Character string. Prefix for the lagged variable names.

Value

Returns a data frame.

Examples

```
data <- data.frame(
  id = rep(1:2, each = 3),
  time = rep(1:3, times = 2),
  y1 = rnorm(6),
  y2 = rnorm(6)
)
LagByID(
  data = data,
  id = "id",
  time = "time",
  observed = c("y1", "y2"),
  lags = 1
)
```

MakeClockTime

Make Clock Time

Description

The function combines a date and a clock time into a POSIXct vector. Clock time can be supplied as decimal hours, for example 13.5, or as a character time, for example "13:30" or "13:30:00".

Usage

```
MakeClockTime(
  date,
  time,
  tz = "UTC",
  date_formats = c("%m/%d/%y", "%m/%d/%Y", "%Y-%m-%d"),
  invalid = c("NA", "error")
)
```

Arguments

date	Date vector. Dates can be supplied as Date, POSIXt, or character values.
time	Numeric or character vector. Clock time in decimal hours, "HH:MM", or "HH:MM:SS" format.
tz	Character string. Time zone passed to as.POSIXct().
date_formats	Character vector. Date formats used to parse character dates.
invalid	Character string. If invalid = "NA", invalid clock times are returned as NA. If invalid = "error", invalid clock times throw an error.

Value

Returns a POSIXct vector.

```

print.dynutillist	<i>Print Method for Object of Class dynutillist</i>
-------------------	---

Description

Print Method for Object of Class dynutillist

Usage

```
## S3 method for class 'dynutillist'  
print(x, ...)
```

Arguments

x	an object of class dynutillist.
...	further arguments.

Author(s)

Ivan Jacob Agaloos Pesigan

Examples

```

if (requireNamespace("simStateSpace", quietly = TRUE)) {
  # prepare parameters
  set.seed(42)
  ## number of individuals
  n <- 5
  ## time points
  time <- 5
  ## dynamic structure
  p <- 3
  mu0 <- rep(x = 0, times = p)
  sigma0 <- 0.001 * diag(p)
  sigma0_l <- t(chol(sigma0))
  alpha <- rep(x = 0, times = p)

    data = data,
    id = "id",
    time = "time",
    observed = paste0("y", 1:p)
  )
  print(out)
}

```

RegularizeTimeByID

Regularize Time by ID

Description

The function inserts rows with missing values so that time follows a regular grid. A global grid uses the same time sequence for every ID. An ID-specific grid uses each ID's own minimum and maximum observed time values.

Usage

```
RegularizeTimeByID(
  data,
  id,
  time,
  observed,
  covariates = NULL,
  delta_t,
  grid = c("global", "by_id")
)
```

Arguments

data	Data frame. A data frame object of data for potentially multiple subjects that contain a column of subject ID numbers (i.e., an ID variable), a column indicating subject-specific measurement occasions (i.e., a TIME variable), at least one column of observed values.
id	Character string. A character string of the name of the ID variable in the data.
time	Character string. A character string of the name of the TIME variable in the data.
observed	Character vector. A vector of character strings of the names of the observed variables in the data.
covariates	Character vector. A vector of character strings of the names of the covariates in the data.
delta_t	Positive number. Time interval.
grid	Character string. If grid = "global", use one time grid from the global minimum to the global maximum time value. If grid = "by_id", use an ID-specific time grid from each ID's minimum to maximum time value.

Value

Returns a data frame.

  time = c(1, 3, 1, 2),
  y = c(10, 12, 20, 21)
)
RegularizeTimeByID(
  data = data,
  id = "id",
  time = "time",
  observed = "y",
  delta_t = 1,
  grid = "by_id"
)
```

ReplaceMissingCode	<i>Replace Missing-Value Codes</i>
--------------------	------------------------------------

Description

The function replaces user-specified missing-value codes with NA in a data frame. The replacement is applied column by column and preserves the original column classes whenever possible.

Usage

```
ReplaceMissingCode(data, values = c(-999, "-999"), columns = names(data))
```

Arguments

data	Data frame.
values	Vector. Values to replace with NA.
columns	Character vector. Names of the columns where replacement should be applied. If NULL, no columns are modified.

Value

Returns a data frame.

Other Dynamic Modeling Utility Functions: [CheckDynData\(\)](#), [DeleteInitialNA\(\)](#), [DeltaTByID\(\)](#), [DetrendByID\(\)](#), [ElapsedTimeByID\(\)](#), [FilterByID\(\)](#), [InitialNA\(\)](#), [InsertNA\(\)](#), [LagByID\(\)](#), [MakeClockTime\(\)](#), [RegularizeTimeByID\(\)](#), [ResolveDuplicateIDTime\(\)](#), [RoundClockTime\(\)](#), [ScaleByID\(\)](#), [SubsetByID\(\)](#), [SummaryByID\(\)](#)

Examples

```
data <- data.frame(
  id = 1:3,
  y = c(1, -999, 3),
  x = c("a", "-999", "c"),
  stringsAsFactors = FALSE
)
ReplaceMissingCode(
  data = data,
  values = c(-999, "-999")
)
```

ResolveDuplicateIDTime

Resolve Duplicate ID-Time Rows

Description

The function resolves exact duplicate id-time rows using a simple deterministic rule. This is useful before inserting missing rows on a time grid because grid-completion functions generally require unique id-time combinations.

Usage

```
ResolveDuplicateIDTime(
  data,
  id,
  time,
  observed = NULL,
  covariates = NULL,
  method = c("first", "last", "max_complete"),
  order_by = NULL,
  decreasing = FALSE
)
```

Arguments

data	Data frame. A data frame object of data for potentially multiple subjects that contain a column of subject ID numbers (i.e., an ID variable), a column indicating subject-specific measurement occasions (i.e., a TIME variable), at least one column of observed values.
id	Character string. A character string of the name of the ID variable in the data.
time	Character string. A character string of the name of the TIME variable in the data.
observed	Character vector. A vector of character strings of the names of the observed variables in the data.

covariates	Character vector. A vector of character strings of the names of the covariates in the data.
method	Character string. Rule used to choose one row from each duplicated id-time group. If method = "first", keep the first row after sorting by id and time. If method = "last", keep the last row after sorting by id and time. If method = "max_complete", keep the row with the largest number of non-missing values in observed.
order_by	Character vector. Optional columns used to break ties after the main method rule.
decreasing	Logical. If TRUE, sort order_by columns in decreasing order.

Value

Returns a data frame with unique id-time rows.

Examples

```
data <- data.frame(
  id = c(1, 1, 1),
  time = c(0, 0, 1),
  y1 = c(NA, 1, 2),
  y2 = c(NA, 1, 3)
)
ResolveDuplicateIDTime(
  data = data,
  id = "id",
  time = "time",
  observed = c("y1", "y2"),
  method = "max_complete"
)
```

RoundClockTime

*Round Clock Time***Description**

The function rounds, floors, or ceilings clock times to a specified unit. It supports POSIXt, Date, and numeric time values.

Usage

```
RoundClockTime(
  x,
  unit = "hour",
  method = c("round", "floor", "ceiling"),
  origin = "1970-01-01",
  tz = "UTC"
)
```

Arguments

x	A POSIXt, Date, or numeric vector.
unit	Character string. Unit to round to. Supported values are "second", "minute", "hour", "day", and their plural forms.
method	Character string. One of "round", "floor", or "ceiling".
origin	Origin for numeric time values. Only used if x is numeric.
tz	Character string. Time zone used when numeric time values are converted to POSIXct.

Value

Returns a vector with rounded times.

Examples

```
x <- as.POSIXct(
  "2020-01-01 10:31:00",
  tz = "America/New_York"
)

RoundClockTime(
  x = x,
  unit = "hour"
)
```

ScaleByID	<i>Scale by ID</i>
-----------	--------------------

Description

The function scales the data by ID.

Usage

```
ScaleByID(
  data,
  id,
  time,
  observed,
  covariates = NULL,
  scale = TRUE,
  obs_skip = NULL,
  cov_skip = NULL,
  ncores = NULL
)
```

Arguments

data	Data frame. A data frame object of data for potentially multiple subjects that contain a column of subject ID numbers (i.e., an ID variable), a column indicating subject-specific measurement occasions (i.e., a TIME variable), at least one column of observed values.
id	Character string. A character string of the name of the ID variable in the data.
time	Character string. A character string of the name of the TIME variable in the data.
observed	Character vector. A vector of character strings of the names of the observed variables in the data.
covariates	Character vector. A vector of character strings of the names of the covariates in the data.

scale	Logical. If scale = TRUE, standardize by id. If scale = FALSE, mean center by id.
obs_skip	Character vector. A vector of character strings of the names of the observed variables to skip centering/scaling.
cov_skip	Character vector. A vector of character strings of the names of the covariates to skip centering/scaling.
ncores	Positive integer. Number of cores to use. If ncores = NULL, use a single core. Consider using multiple cores when number of individuals is large.

Value

Returns a data frame.

  beta <- 0.50 * diag(p)
  psi <- 0.001 * diag(p)
  psi_l <- t(chol(psi))

  library(simStateSpace)
  ssm <- SimSSMVARFixed(
    n = n,
    time = time,
    mu0 = mu0,
    sigma0_l = sigma0_l,
    alpha = alpha,
    beta = beta,
```

```

    psi_l = psi_l,
    type = 0
  )
data <- as.data.frame(ssm)
ScaleByID(
  data = data,
  id = "id",
  time = "time",
  observed = paste0("y", 1:p)
)
}

```

SubsetByID

*Subset Data Set by ID***Description**

The function creates a list of data frames for each ID.

Usage

```
SubsetByID(data, id, time, observed, covariates = NULL, ncores = NULL)
```

Arguments

data	Data frame. A data frame object of data for potentially multiple subjects that contain a column of subject ID numbers (i.e., an ID variable), a column indicating subject-specific measurement occasions (i.e., a TIME variable), at least one column of observed values.
id	Character string. A character string of the name of the ID variable in the data.
time	Character string. A character string of the name of the TIME variable in the data.
observed	Character vector. A vector of character strings of the names of the observed variables in the data.
covariates	Character vector. A vector of character strings of the names of the covariates in the data.
ncores	Positive integer. Number of cores to use. If ncores = NULL, use a single core. Consider using multiple cores when number of individuals is large.

Value

Returns a list by ID numbers.

  SubsetByID(
    data = data,
    id = "id",
    time = "time",
    observed = paste0("y", 1:p)
  )
}
```

Description

The function returns a diagnostic table with one row per ID.

Usage

```
SummaryByID(data, id, time, observed, covariates = NULL)
```

Arguments

data	Data frame. A data frame object of data for potentially multiple subjects that contain a column of subject ID numbers (i.e., an ID variable), a column indicating subject-specific measurement occasions (i.e., a TIME variable), at least one column of observed values.
id	Character string. A character string of the name of the ID variable in the data.
time	Character string. A character string of the name of the TIME variable in the data.
observed	Character vector. A vector of character strings of the names of the observed variables in the data.
covariates	Character vector. A vector of character strings of the names of the covariates in the data.

Value

Returns a data frame with one row per ID.
